Monitor: scalp-ready stocks by a score

The simplest screen on the page: every streaming stock scored 0-100 on how good it is for a quick in-and-out trade right now. What the score is made of, what the filters do, and how to use it with the other tabs.

What a "scalp" is
A scalp is a very short trade: in and out within minutes for a few rupees a share. It only works on a stock that **moves enough per minute**, is **cheap to trade** (the gap between buyers' and sellers' prices is tiny) and has **plenty of money flowing** so your order fills at once. The Monitor checks exactly those three things.

1. What you see

A mock of the table. The real one updates every 10 seconds while scans are on, and every stock's name opens its Groww page.

2. The columns, in plain words

COLUMN	WHAT IT MEANS	WHAT IS GOOD
Score	0-100: how scalp-ready the stock is right now, adding up the checks below.	Higher is better; 60+ is worth a look, 80+ is lively and cheap to trade.
ATR %/min	How much the price typically moves in one minute, as % of its price.	At least 0.03%: on a ₹1,000 stock that is ₹0.30 of movement a minute. Below that, the charges eat the scalp.
Spread	The gap between the best buy price and the best sell price, in %. You pay it twice (in and out).	Under 0.10%. A 0.05% spread on ₹1,000 costs ₹0.50 a share on the way in and again on the way out.
Traded today (₹ cr)	Money that has flowed through the stock today, in crores.	₹20 cr or more means your own order will not move the price.
Bias	Which way today's readings lean: LONG (up, buy) or SHORT (down, sell first).	A clear bias is easier to trade than NONE.
LTP	The last traded price (the live price).	Use the LTP range box to keep stocks in a price band you are comfortable with.

3. How to use it, step by step

1. Make sure the top bar says **LIVE NSE**. On the simulated feed the prices are invented and the scores mean nothing.

2. Keep **Scalp-ready only** ticked. The filters above the table are the three checks; the defaults are sensible for a beginner.
3. Sort by **Score** (click the header). The top rows are the liveliest, cheapest-to-trade stocks right now.
4. Tick two or three and press **Arm ticked**, or **Arm** on one row. Pick a practice bot and keep the suggested stop and trail. The bot waits for its own signal; nothing is bought now.
5. Come back every 15-30 minutes. A stock that was scalp-ready at 10:00 can go quiet by 11:00; the score drops and it leaves the list.

4. A worked example

SBIN at 10:42: price ₹812.40, ATR 0.06%/min, spread 0.02%, ₹142 cr traded, score 82, bias LONG.

- 0.06% of ₹812 is about **₹0.49 of movement a minute**: in 10 minutes it typically wanders ₹5. A ₹3 scalp is realistic.
- The spread costs 0.02% × 2 = 0.04% round trip, about **₹0.32 a share**. Brokerage and taxes add roughly another ₹0.40. A ₹3 move leaves most of it.
- ₹142 cr traded: an order of 100 shares (₹81,000) is a drop in the ocean; it fills at once.
- Bias LONG: today's readings lean up, so the bot's next buy signal is the one to expect.

Compare: a stock that looks busy but is not scalp-ready
A ₹60 stock with ATR 0.02%/min moves about ₹0.012 a minute. Even a good 10-minute move is ₹0.12 a share, less than the charges. The Monitor gives it a low score however many shares trade.

5. Benefits, and what it cannot do

Why it helps

- One number sums up three things you would otherwise check by hand.
- Filters stop you from arming a stock that cannot pay its own charges.
- The bias tells you which side to expect.

What it does not know

- It does not know whether the stock is **trending or choppy**: a choppy stock can score 80. Check **Trend quality** before arming.
- It does not place orders. The bot does, on its own signal, only on armed stocks.

6. Words used here

Scalp
A quick trade for a few rupees a share, closed within minutes.

ATR % per minute
The stock's typical movement per minute as a percentage of its price. Example: 0.05% on ₹1,000 ≈ ₹0.50 a minute.

Spread
Best sell price minus best buy price. Paid on the way in and the way out. Example: Bid ₹500.00 / ask ₹500.20 = 0.04%.

Money traded (₹ cr)

Shares × price, today, in crores.

Bias

The side today's readings favour: LONG (buy) or SHORT (sell first).

Arm

Put a stock on a bot's Trade list. The bot trades it only on its own signal.

Practice money and candles only: nothing on the Scalp page places an order. The bots trade only the stocks you arm, in PAPER (practice) mode unless you switch one to LIVE yourself.
