Cross scan: which stocks may signal next

The bot buys or sells when its two average lines cross. This tab lists the stocks whose lines are closing in on each other, soonest first, so you can arm a stock before its signal instead of after it.

In one sentence

Two smooth lines follow the price: a fast one (SMA 9, the average of the last 9 candles) and a slow one (SMA 21). When the fast line crosses **above** the slow one the bot buys; when it crosses **below**, the bot sells short. The Cross scan measures how far apart the lines are now and how fast the gap is closing, and says "a cross in about N minutes".

1. The picture

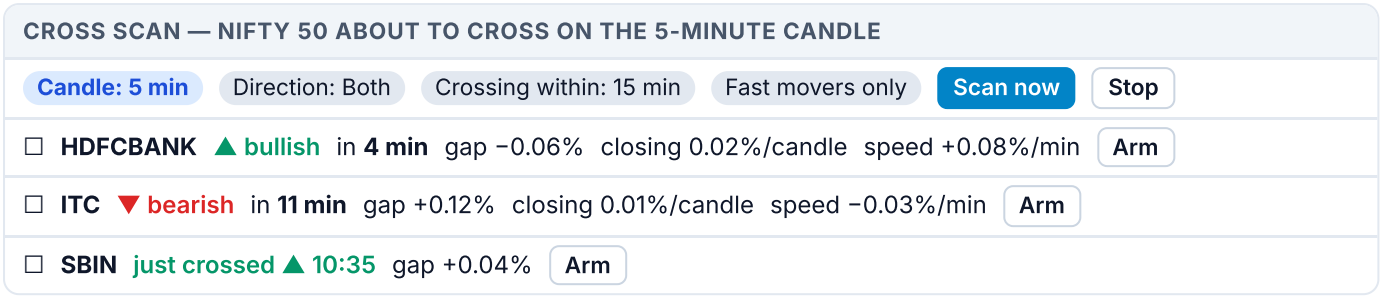

The fast (red) line was below the slow (blue) line while the stock drifted down. As the price turns up the gap closes; the scan lists the stock while the gap is still closing and says roughly when the lines will meet. (Short averages are drawn so the picture fits.)

2. How it works, in plain words

- Groww gives 1-minute candles. The scan groups them into the candle size you choose (5 minutes by default) and works out the two averages **exactly as the bot does**, on closed candles only.
- **Gap %** is the distance between the lines as a percentage of the price. **Closing / candle** is how much of that gap closes each candle, judged on the last few candles.
- **In** = gap ÷ closing speed, in minutes: an estimate of when the lines meet *if the pace holds*. A stock can turn away and never cross.
- **Just-crossed** stocks (the lines met in the last few candles) are listed too, marked separately, with the direction of the cross.
- Each row also shows the stock's **speed** (% per minute over the last 10 minutes) and **volume** today, from the same candles.

3. How to use it, step by step

1. Pick the **stocks** (Armed, All F&O, Nifty 50 ...) and the **candle** size. Use the same candle size your bot trades on, or the scan's "in N min" will not match the bot's signal.
2. Press **Scan now**. The stocks are read one at a time (a few seconds each), so a full F&O scan takes a couple of minutes; **Stop** keeps what has been read so far.
3. Read the top rows: smallest **In** first. **Direction** filters bullish (buy signals) or bearish (sell signals); **Crossing within** hides stocks whose cross is far off.
4. Before arming, check the stock is not choppy: open **Trend quality** or tick it and press *Read trend quality* from Most active. A stock that crosses five times a day gives five false starts.
5. **Arm** the ones you like (or tick several and **Arm ticked**). The bot still waits for the cross on its own candle; arming never buys by itself.
6. After the close, **History** keeps this scan: press *Check accuracy* to see whether the predicted crosses came and how far the stocks moved after them.

4. A worked example

HDFCBANK at 10:31 on 5-minute candles: SMA 9 ₹1,640.10, SMA 21 ₹1,641.10, so the gap is −₹1.00, which is −0.06 % of the price. Over the last three candles the gap closed by about ₹0.33 a candle (0.02 %).

- ₹1.00 ÷ ₹0.33 per candle ≈ 3 candles ≈ **15 minutes**; the table rounds the pace and says "in 4 min" if the last candle closed most of it.
- If the price keeps rising, the lines meet around 10:45 and the bot (if HDFCBANK is armed and the bot's checks agree) buys at the start of the next candle.
- If the price stalls at ₹1,640, the gap stops closing, the stock drops out of the list, and nothing happens. The scan is a heads-up, not a promise.

5. Benefits, and what it cannot do

Why it helps

- You arm a stock a few minutes **before** its signal, so the bot is already watching when it comes.
- It uses the bot's own arithmetic, so what it calls a cross, the bot calls a cross.
- Speed and volume on each row stop you from arming a sleepy stock.

What it cannot do

- It cannot know the cross will happen: a gap can stop closing.
- It does not judge chop. Pair it with Trend quality.
- It never places an order; only the bot does, and only on an armed stock, on its own candle.

Common beginner mistakes

- Scanning on 1-minute candles and arming a bot that trades 5-minute candles: the bot sees a different cross at a different time.
- Arming every row. Three to five stocks is enough; more only hides which ones worked.
- Treating "in 2 min" as certain and buying by hand. Let the bot take its own signal with its stop in place.

6. Words used here

SMA 9 / SMA 21
The average close of the last 9 / 21 candles, drawn as the fast and slow line.

Cross
The fast line crossing the slow one: above = bullish (buy), below = bearish (sell short).

Gap %
Distance between the two lines as % of the price; sign tells which is on top. Example: −0.06 % means the fast line is just under the slow one.

Closing / candle
How much of the gap closes each candle, judged on the last few.

In (minutes)
Gap ÷ closing pace: when the lines meet if the pace holds.

Just-crossed
The lines met within the last few candles.

Speed
Price change over the last 10 minutes, % per minute, with its sign.

Closed candle
A candle whose time is over; the one still forming is never read.

Practice money and candles only: nothing on the Scalp page places an order. The bots trade only the stocks you arm, in PAPER (practice) mode unless you switch one to LIVE yourself.
